Enema treatments may be successful if the cat is experiencing mild to moderate constipation. A soapy water enema or one containing mineral oil may be the best choice. An enema treatment works by injecting liquid into the rectum and colon, forcing the lower intestinal tract to expand.

Manual removal of the feces while under anesthesia may be required if enemas fail to produce expected results. All cats should be intubated due to the risk of vomiting when large amounts of warm water are infused into the colon with massage and breaking down of fecal material.

If enemas are unsuccessful, manual extraction of impacted feces may be needed. After adequate rehydration, the animal should be anesthetized with an endotracheal tube in place to prevent aspiration in case the colonic manipulation induces vomiting. Complete removal of all feces may require 2–3 attempts over as many days.
